

SmartMic™

“Did I really hear you say that....”

Key Features & Benefits

Remote Design Avoids Engine Noise Interference.

Electronically Filters Out Road Noise.

Adjusts Audio Levels For Optimum Performance.

Ultra Compact And Light Weight Design.

Plug-And-Play Design For Ease Of Installation.

Manufactured From High-Impact Polycarbonate.

Overpowering diesel engines, constant road noise and poor acoustics all combine to make the effective recording of audio on a school bus a difficult task at the best of times.

Add to this the expected noise level when you have a bus full of students, and you know only too well that being able to hear what was said during the recording of the accompanying video will be near impossible.

But what if you could overcome these problems? Would your job become easier, less stressful? Wouldn't it make a difference to your overall job satisfaction.

Using a customized technology, the SmartMic™, is guaranteed to enhance audio recording quality. SmartMic™ technology provides three unique advantages working in unison to provide consistently clear audio:

- Remote Installation.
- Advanced Filtering.
- Automatic Audio Compression.

How do these advantages benefit you? What exactly do they mean?

The remote installation aspect of the SmartMic™ allows distance between the rumble of the bus engine and the microphone. This feature also allows the microphone to be mounted in close proximity to the center or rear of the bus in order to record a wider range of voices.

Advanced Filtering Technology aids in the elimination of recording the sound frequencies often consistent with road and bus engine noise. The advanced filtering allows for a more consistent and reliable audio recording of voices on the bus.

Automatic Audio Compression gives The SmartMic™ the ability to adapt to various sound environments and adjust the audio level to provide added reliability and clarity to your audio recording. The SmartMic™ has the capability to automatically adjust in order to level out dominating voices and amplify the quiet ones.

People's voices only cover a specific range of frequencies, and it is these frequencies that the SmartMic™ has been designed and developed to capture. The SmartMic™ comes complete with a custom locking connector and is compatible with most video monitoring systems.
