

MAXVIEW™ Find It. Save It. Share It.™
Voted Easiest To Use Software In The Industry

Key Features & Benefits

- Quick-Search™
- Video integration with vehicle sensors
- Quad-Select™
- Quickly drag and drop video clips
- Integrated sensor and alarm management
- Integrated video and mapping
- Synchronized four channel video playback

MAXVIEW™ Video Management Software program is an innovative, easy to use software application providing transportation managers critical information that increases student and driver safety, decreases risk and reduces liability while improving operational efficiency.

MAXVIEW™ enables transportation managers to view, save and share evidence data from all NITRO™ mobile digital video systems at individual or multiple work stations across Local Area Networks (LAN). Evidence data integrated to multiple video channels include audio, vehicle sensors, GPS, time and date, vehicle speed, operator ID and mapping coordinates, enabling transportation managers to have complete operational scope from each bus route.

MAXVIEW™ is the common application software for all NITRO™ Mobile Digital Video Systems and is bundled free of charge. In addition, unlimited seat licenses are provided complimentary with every NITRO™ system and include the following features:

Quick-Search™ functionality gives virtual instant access to video and integrated sensor information saving the operator hours of time attempting to find critical information stored on the COMRAD™.

Video integration with vehicle sensors including GPS location for synchronized video and display of GPS data on street map.

Quad-Select™ multi-camera clip management system provides users a fast and easy way to select video and integrated sensor information from up to four video cameras simultaneously. Quickly drag and drop video clips to a folder on the desktop for viewing or shared over LAN Integrated sensor and alarm management gives user instant access to synchronized sensor activity with video and audio.

Integrated video and mapping provides actual information of when and where students boarded and exited the bus. Verification of passenger activity is retained as part of archived video for post-operational analysis and evidence preparation.

Synchronized four channel video playback allows you to monitor activity from every camera simultaneously while keeping main camera blown up to full resolution. Point and click on individual images automatically switches it to full resolution.

Integrated Map Records Bus Route
